Assignment 58, Strings as a value-class

We implemented the copy and move constructor as well as the assignment operator.

Code listings

Listing 1: strings.h

```
1  #ifndef STRINGS_H
2  #define STRINGS_H
3
4  #include <cstddef>
5  #include <string>
6
7  class Strings
8  {
9      std::string **d_str = new std::string*[1];
10     size_t d_size = 0;
11     size_t d_capacity = 1;
12
13     public:
14         Strings() = default;
15         Strings(size_t argc, char **argv);
16         Strings(char **environ);
17         Strings(Strings const &other);
18         Strings(Strings &&temp);
19         ~Strings();
20         Strings &operator=(Strings const &rvalue);
21
22         void swap(Strings &other);
23
24         size_t size();
```

```

25     size_t capacity();
26
27     void resize(size_t size);
28     void reserve(size_t size);
29
30     void addString(std::string newString);
31     void addString(char *charArray);
32
33     std::string at(size_t index);
34     std::string const at(size_t index) const;
35
36     std::string **rawPointers(size_t amount);
37 };
38
39 #endif

```

Listing 2: Copy constructor

```

1  #include "strings.ih"
2
3  Strings::Strings(Strings const &other)
4  :
5      d_str(new string *[other.d_capacity]),
6      d_size(other.d_size),
7      d_capacity(other.d_capacity)
8  {
9      for (size_t index = 0; index != d_size; ++index)
10         d_str[index] = new string(*other.d_str[index]);
11 }

```

Listing 3: Move constructor

```

1  #include "strings.ih"
2
3  Strings::Strings(Strings &&temp)
4  :
5      d_str(temp.d_str),
6      d_size(temp.d_size),
7      d_capacity(temp.d_capacity)
8  {
9      temp.d_str = 0;
10     temp.d_size = 0;
11     temp.d_capacity = 0;
12 }

```

Listing 4: Assignment operator

```

1  #include "strings.ih"
2

```

```

3 Strings &Strings::operator=(Strings const &rvalue)
4 {
5     Strings copy(rvalue);
6     swap(copy);
7     return *this;
8 }

```

Listing 5: swap.cc

```

1 #include "strings.ih"
2
3 void Strings::swap(Strings &other)
4 {
5     char bytes[sizeof(Strings)];
6     memcpy(bytes, this, sizeof(Strings));
7     memcpy(this, &other, sizeof(Strings));
8     memcpy(&other, bytes, sizeof(Strings));
9 }

```

Assignment 59, swapping

Here we answer some questions about swapping.

Example code

```

1 void Class::swap(Class &other)
2 {
3     char buffer[sizeof(Class)];
4     memcpy(buffer, this, sizeof(Class)); //Operation 1
5     memcpy(this, &other, sizeof(Class)); //Operation 2
6     memcpy(&other, buffer, sizeof(Class)); //Operation 3
7 }

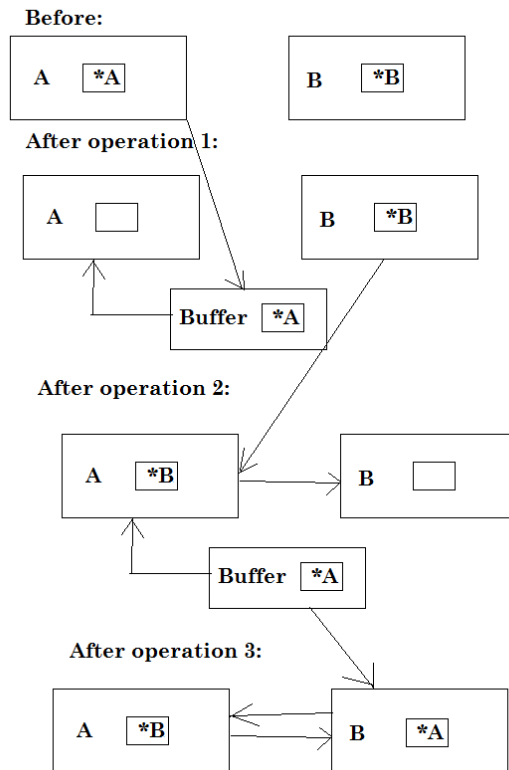

```

Explanation

Before the fast swap is done, an object A has a pointer data member *A to itself and an object B has a pointer data member *B to itself. Pointers are variables that hold a memory address (in this case its current object). The pointers keep pointing to the memory address they were defined for. After operation 1, the pointer *A is moved to the buffer, but still points to its previous current object A. After operation 2, the pointer *B is moved to object A, but still points to its previous current object B. After operation 3, the pointer *A is moved to object B, and is still pointing to object A. This results in a situation where the objects have swapped data members, however they now point to each other. So the self-pointing property of the class is gone.

Using the keyword 'this' prevents this situation. The 'this' keyword is placed in front of the data member and then points to the current object where the data member resides. After doing the swapping like above but with the 'this' keyword, the data members of A and B are swapped. They still have the 'this' keyword in front of them and now it still a self-pointing class.

Figure 1: A before-after diagram

Assignment 60, the default keyword

In the example of slide 30, 'default' wasn't specified for the copy constructor because it would defeat the purpose of explicitly defining it, which is to prevent wild pointers. In that case, the trivial copy constructor would be used, copying struct- or class- objects member-wise and, considering that the class allocates memory for its own use, resulting in wild pointers.

One case where specifying default for a copy constructor could make sense would be for a class that simultaneously:

1. does NOT have pointer data members pointing at its own data and
2. have had its copy constructor suppressed by declarations of either the move constructor or the move assignment operator.

Another would be to default the copy constructor in the header file as a form of documentation, to make it clear for the users.

Assignment 61, copy elision

Here we show some situations where copy elision is and isn't used.

Assignment 62

We have constructed a `Matrix` class that can handle any size matrix according to the specifications of the assignment. All requested functions have been implemented and an example main function has been made showing off valid and invalid uses.

Matrix class

Listing 6: matrix.ih

```
1  #include "matrix.h"
2  #include <cstdint>
3  #include <cstring>
4  #include <initializer_list>
5  #include <iostream>
6
7  using namespace std;
```

Listing 7: matrix.h

```
1  #ifndef MATRIX_H_
2  #define MATRIX_H_
3
4  #include <cstdint>
5  #include <initializer_list>
6
7  class Matrix
8  {
9      size_t d_nRows = 0;
10     size_t d_nCols = 0;
11
12     double *d_data = new double[0];
13
14     public:
15         Matrix() = default;
16         Matrix(size_t nRows, size_t nCols);
17         Matrix(std::initializer_list<
18             std::initializer_list<double>>> rows);
19         Matrix(Matrix const &other);
20         Matrix(Matrix &&other);
21         ~Matrix();
22         Matrix &operator=(Matrix const &other);
23         Matrix &operator=(Matrix &&other);
24         Matrix &tr();
25
26         void swap(Matrix &other);
27
28         size_t nRows();
```

```

29     size_t nCols();
30     double *row(size_t index);
31
32     Matrix transpose();
33     static Matrix identity(size_t dim);
34
35 private:
36 };
37
38 #endif

```

Listing 8: copyconstructor.cc

```

1  #include "matrix.ih"
2
3  Matrix::Matrix(Matrix const &other)
4  :
5      d_nRows(other.d_nRows),
6      d_nCols(other.d_nCols),
7      d_data(new double[other.d_nRows * other.d_nCols])
8  {
9      size_t size = other.d_nRows * other.d_nCols;
10     for (size_t index = 0; index != size; ++index)
11         d_data[index] = other.d_data[index];
12 }

```

Listing 9: destructor.cc

```

1  #include "matrix.ih"
2
3  Matrix::~Matrix()
4  {
5      delete[] d_data;
6  }

```

Listing 10: identity.cc

```

1  #include "matrix.ih"
